

# Aluminum Foil

The Aluminum foil windings combine a simple winding technique with a high degree of electrical safety. The insulation is subjected to less electrical stress than in other types of windings. In a conventional round-wire winding, the interturn voltage can add up to twice the interlayer voltage, while in a foil winding it never exceeds the voltage per turn because a layer consist of only one winding turn. Result: a high AC voltage and impulse-voltage withstand capacity. The thermal expansion coefficients of Aluminum and cast resin are so similar that thermal stresses resulting from load changes are kept to a minimum.
